

ZonaSnap User Guide

ZonaSnap has two ways of execution:

1. **Through the main icon:** Take a screenshot of what is on display at the moment, it is best to configure the application in one of the lateral keys (left or right).
2. **Through a Menu Item called ZonaSnap:** This item will be added to your BlackBerry menu by default after installation, it will also take an automatic screenshot.

Execution through the main icon:

After the screen capture is taken, a preview of the image will show up. And a menu with a variety of options will be available for the use of the image, such as:

Send to Photobucket:

If this is the first time you run ZonaSnap, you will be prompted for the registration of your Photobucket account and asked the following information:

Your Photobucket user name

Mobile Photobucket Pin: PIN number assigned by Photobucket. This pin is NOT the same as the one used in BlackBerry Messenger.

In case, you don't have a Photobucket account, select the option "Create an account". Selecting this option starts the native BlackBerry Browser and opens the page: <http://m.photobucket.com>.

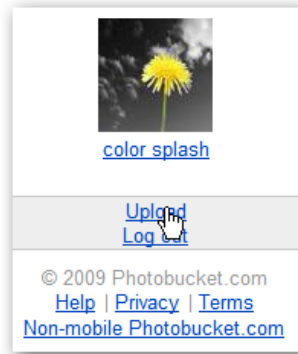

If you already registered your Photobucket account in ZonaSnap, a dialog asking if you want to send the screenshot to the previously-set Photobucket account, or if you want to use a new one will be shown. If you select "Send" the screenshot will be sent to your Photobucket account. If you select "Use another account" a dialog will be displayed asking for the information for the new account.

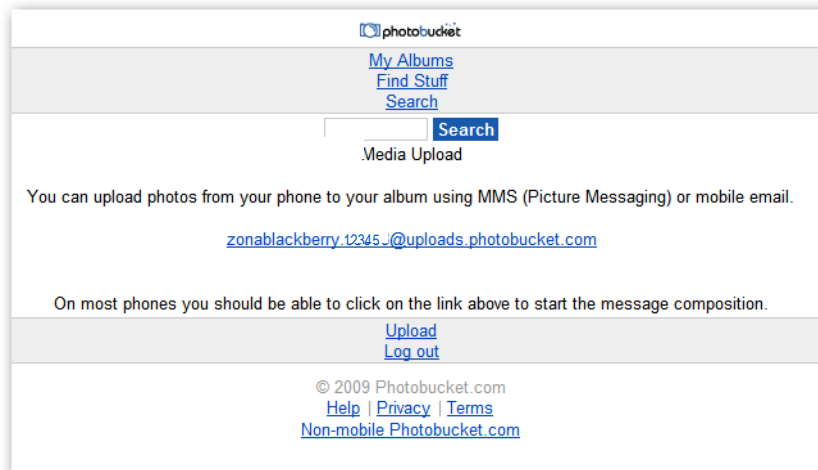

Mobile Pin assigned to your Photobucket account:

If you are in the mobile version of Photobucket <http://m.photobucket.com> Select Upload as shown in the image below:

And you'll see the next web page:

In this case, User Name is: **zonablackberry** and Mobile Pin is: **12345**

If you are in the PC, you must select Account Options and then you see the Mobile pin

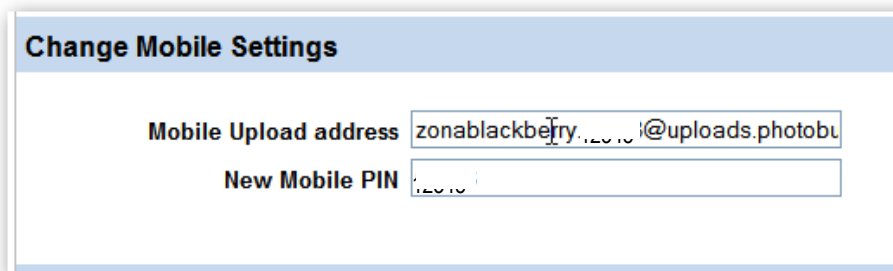

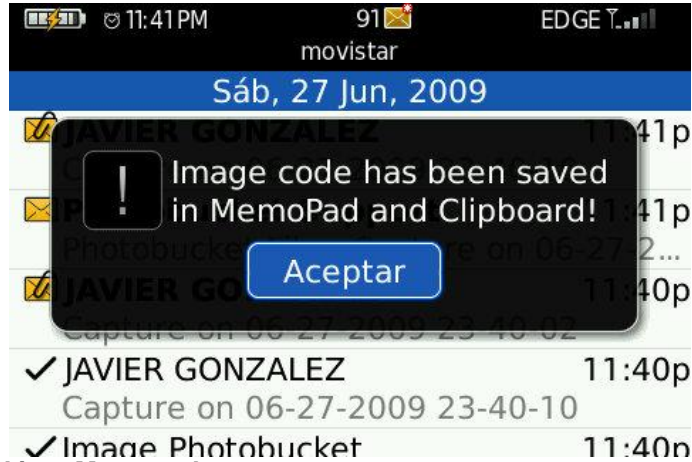

Image code service to post in forums and bulletin boards

• Notification of receipt of the image code from the capture sent to Photobucket:

If the account is registered correctly, within minutes of the capture being sent to Photobucket, you will receive a notification in a window reporting that the image code has been received and it has been inserted into Memopad. The image tag is a label used to wrap the url of an image. By pasting this code into the forum post or bulletin board, you have inserted the image stored in the Photobucket server (This service will depend on the stability of the data network and the rapidity of the Photobucket servers).

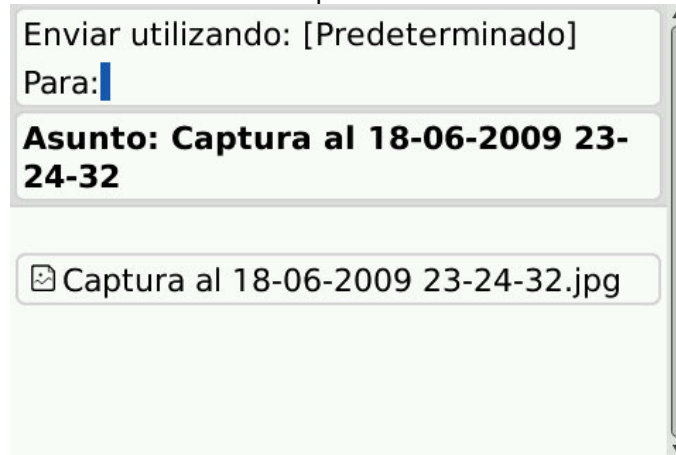

• Image tag inserted into Memopad:

At the time when the notification arrives, the image code will be inserted into the Notepad under the title: "ZonaSnap image code at: + Date and time of receipt".

Send capture as Email:

This option allows us to attach the capture directly to an email. This will open the email editing screen and you can choose who to send the capture too.

Save capture:

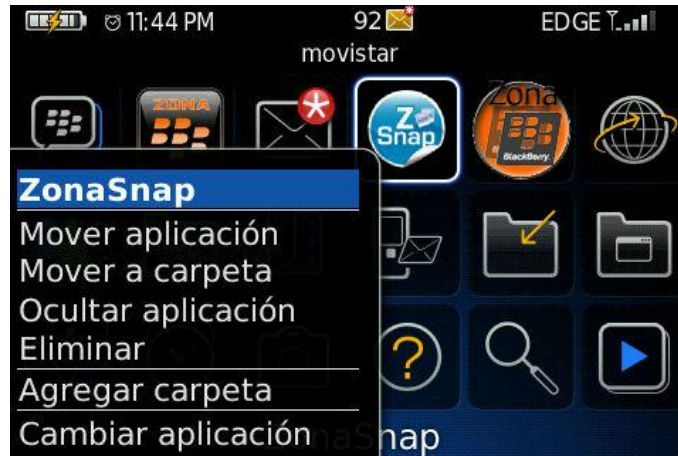

This option allows you to save the screenshot to the SD card, if you don't have SD, the capture is saved in the device memory. The capture is stored in: <file:///SDCard/BlackBerry/pictures/ZonaSnap/> or <file:///store/home/user/BlackBerry/pictures/ZonaSnap/> respectively.

All screenshots are stored in the format: Capture at (Date) (Time). Jpg

Execution by the ZonaSnap menu item:

In most of the menus you will find this item named "ZonaSnap". After you execute the application a preview of the image is show up. And also, a menu with the options listed above will be available.
